

example_ipbus

Version: 1.0

Monday 9th December, 2024 10:48

An example module that contain all the register types that are currently supported by bust.

1 Register List

#	Name	Mode	Address	Type	Width	Reset
0	reg0	RW	0x00000000	SL	1	0x0
1	reg1	RW	0x00000004	SL	1	0x1
2	reg2	RO	0x00000008	SL	1	0x0
3	reg3	RW/STALL	0x0000000C	SLV	8	0x3
4	reg4	RO	0x00000010	SLV	14	0x0
5	reg5	RW	0x00000014	DEFAULT	32	0xFFFFFFFF
6	reg6	RO	0x00000018	DEFAULT	32	0x0
7	reg7	RW	0x0000001C	FIELDS	21	0xAD7
8	reg8	RO	0x00000020	FIELDS	24	0x0
9	reg9	PULSE	0x00000024	SL	1	0x1
10	reg10	PULSE	0x00000028	SLV	4	0xA
11	reg11	PULSE	0x0000002C	FIELDS	16	0x3

2 Registers

Register 2.1: REG0 - RW (0x00000000)
RW std_logic register that resets to 0x0

Register 2.2: REG1 - RW (0x00000004)
RW std_logic register that resets to 0x1

Register 2.3: REG2 - RO (0x00000008)
RO std_logic register

31	1	0
-	0	Reset

Register 2.4: REG3 - RW - STALL FOR 30 CYCLES (0x0000000C)
RW std_logic_vector[7:0] register that resets to 0x3. Reading and writing from this register is stalling the bus for 30 extra clock cycles.

31		8	7		0
-			0x3		Reset

Register 2.5: REG4 - RO (0x00000010)
RO std_logic_vector[13:0]

31		14		13		0	
						Reset	

Register 2.6: REG5 - RW (0x00000014)
Default RW register that resets to 0xFFFFFFFF

31	0
0xFFFFFFFF	Reset

Register 2.7: REG6 - RO (0x00000018)
Default RO register

31	0
0x0	Reset

Register 2.8: REG7 - RW (0x0000001C)
RW register that have multiple fields

unused		field3		field2	field1	field0	
31	21	20	6	5	4	1	0
-		0x2B		0	0xB	1	Reset

field0 std_logic that resets to 0x1

field1 std_logic_vector[3:0] that resets to 0xb is not a valid reset value

field2 std_logic that resets to 0x1

field3 std_logic_vector[14:0] that resets to 0x2b

unused		field3	field2	field1	field0
31	24	23 21	20	19 1	0
-		0x0	0	0x0	0 Reset

```
field3  std_logic_vector[2:0] field
```

31	1	0
-	1	Reset

31	4	3	0
		0xA	Reset

31		16		15		14		0	
				0		0x3		Reset	

field1 std_logic field that resets to 0x0
